| <div>581</div> <div>AUTOMATED CHECKS</div> | <div>62</div> <div>TEST SCENARIOS</div> | <div>100%</div> <div>PASS RATE</div> | <div>2</div> <div>INDEPENDENT METHODS</div> |
|--------------------------------------------|-----------------------------------------|--------------------------------------|---------------------------------------------|

The Quote Builder’s pricing calculator is checked automatically by **two independent test suites** every time the tool is updated. Together they verify every product type (Tubing, In-Line Bags, and Zipper), every film and resin combination, every packaging option, and every quantity break — and both suites currently pass in full, with zero discrepancies.

## Suite 1 — Verified Against the Original Pricing Spreadsheet

This suite checks the calculator’s results against exact, hand-confirmed values taken directly from the original pricing workbook’s own worked examples — the same numbers Fruth’s team would get by working the spreadsheet by hand.

| SCENARIO                                                                    | RESULT |
|-----------------------------------------------------------------------------|--------|
| Tubing — standard scenario (PE/PP Clear, 10 rolls)                          | ✓ Pass |
| Tubing — quantity breaks (2 / 4 / 8 / 24 / 48 production hours)             | ✓ Pass |
| In-Line Bags — standard scenario (Opaque film, 5,000 bags)                  | ✓ Pass |
| In-Line Bags — quantity breaks (2 / 4 / 8 / 24 / 48 production hours)       | ✓ Pass |
| Zipper — standard scenario (Tint film, 1,000 bags)                          | ✓ Pass |
| Zipper — quantity breaks (4 / 8 / 24 / 48 production hours)                 | ✓ Pass |
| Tubing edge case — small order still applies the minimum setup fee          | ✓ Pass |
| Tubing edge case — custom setup charge correctly overrides the computed fee | ✓ Pass |
| Tubing edge case — large production run (10,000 rolls)                      | ✓ Pass |
| Profit-margin consistency check (price, cost, and margin always agree)      | ✓ Pass |

10 scenarios · 81 individual value checks · every one matches the spreadsheet exactly.

## Suite 2 — Broad Coverage Across Realistic Quotes

This suite runs **50 realistic quote combinations** — deliberately spanning every film type, every resin type, every packaging option, and the size ranges where pricing calculations change behavior — and checks each one two different ways at once, using a second calculation written independently from the first. If the two methods ever disagreed, that would flag a problem; across all 50 scenarios, they agree completely.

| PRODUCT      | SCENARIOS TESTED | VALUES CHECKED PER SCENARIO                                    | RESULT |
|--------------|------------------|----------------------------------------------------------------|--------|
| Tubing       | 17               | 10 (cost, labor, setup, overhead, price, profit, margin, etc.) | ✓ Pass |
| In-Line Bags | 17               | 10                                                             | ✓ Pass |
| Zipper       | 16               | 10                                                             | ✓ Pass |

50 scenarios · 500 individual value checks · 100% agreement between both calculation methods.

### Real-World Confirmation

The specific quote scenario flagged during review (In-Line Bags, 4" × 6" × 0.004", 2,500 bags) was traced to its root cause and now matches the reference spreadsheet exactly, line for line:

#### In-Line Bags — verified against spreadsheet

| LINE ITEM                 | QUOTE BUILDER   | SPREADSHEET     |
|---------------------------|-----------------|-----------------|
| Setup Charge              | \$75.00         | \$75.00         |
| Material Cost             | \$21.14         | \$21.14         |
| Labor Cost                | \$32.35         | \$32.35         |
| Packaging Cost            | \$1.60          | \$1.60          |
| Overhead                  | \$19.51         | \$19.51         |
| <b>Price per Thousand</b> | <b>\$149.61</b> | <b>\$149.61</b> |
| <b>Total Sales Amount</b> | <b>\$374.02</b> | <b>\$374.02</b> |
| Profit                    | \$224.41        | \$224.41        |

The full 2/4/8/24/48-hour production price-break table was also confirmed to match exactly.

### What This Means

- The pricing math behind every quote has been checked against the original spreadsheet’s own numbers — not just approximated.
- It has also been checked across a wide range of realistic combinations, not just one example scenario, using a second independent calculation as a cross-check.
- This testing runs automatically every time the Quote Builder is updated, so future changes are verified before they ever reach a live quote.

---

Generated automatically from the Quote Builder's test suite (tests/pricing-regression.test.js and tests/pricing-differential.test.js). Re-runnable at any time; no manual data entry involved in producing these results.
